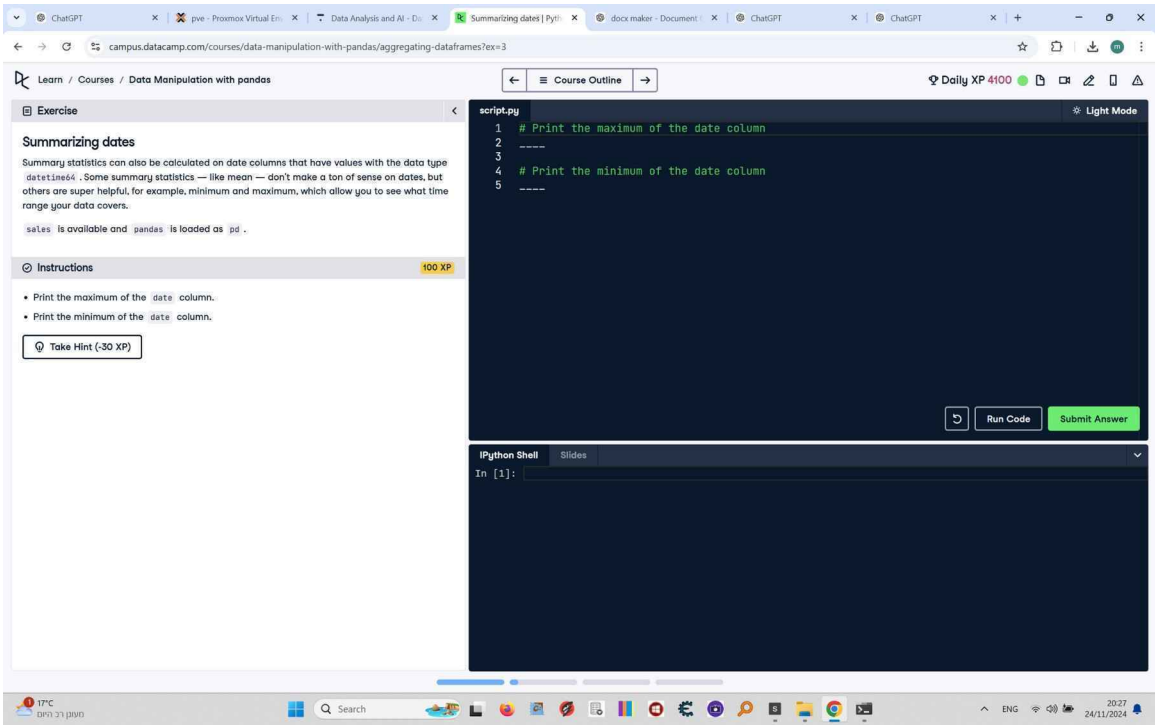
Summarizing Dates

This document includes the question, the solution, and a breakdown of the code provided in the screenshot.

Uploaded Screenshot

Below is the screenshot of the task:



Question

1. Print the maximum of the `date` column.
2. Print the minimum of the `date` column.

Answer

```
# Print the maximum of the date column
print(sales['date'].max())

# Print the minimum of the date column
print(sales['date'].min())
```

Code Explanation

Explanation of the code:

1. `sales['date'].max()`: Calculates the latest (maximum) date in the `date` column of the `sales` DataFrame.

2. `sales['date'].min()`: Calculates the earliest (minimum) date in the `date` column of the `sales` DataFrame.

These calculations are helpful to determine the range of dates covered in the dataset.
