****Question:****

Now that you've established a framework to identify suitable use cases, it's time to put it into action!

A cloud systems provider called Nimbus Inc. has begun auditing their internal processes to identify opportunities to streamline them using ChatGPT.

One long and difficult process they have is drafting data privacy agreements for their enterprise customers, which requires legal counsel and often lengthy talks between both parties. One idea is to request that customers list their requirements in written form, which will be inputted into ChatGPT to generate the appropriate agreements.

Is this a suitable application for ChatGPT?

Correct Answer:

- **Unsafe or irresponsible to use ChatGPT.**

Explanation:

1. **Why this is the correct choice:**

- Using ChatGPT to generate data privacy agreements is unsafe or irresponsible because these documents involve sensitive legal and confidential data. The risk of data exposure or privacy violations makes this use case unsuitable. Additionally, such agreements require high accuracy and validation from legal professionals, something that AI cannot fully guarantee.

Other Options (Incorrect):

1. **Able to use ChatGPT:**

- This is incorrect because the task involves sensitive data that requires human oversight and compliance with legal standards.

2. **Can use ChatGPT providing it meets the terms of use:**

- While the terms of use are important, they do not address the fundamental issue of handling sensitive data responsibly.

3. **Difficult to use ChatGPT due to privacy concerns:**

- Although privacy concerns are valid, this option does not fully capture the risks or irresponsibility involved in applying ChatGPT to this specific use case.
