

Converting Baseball Players' Height from Inches to Meters Using NumPy

Below is the image showing the exercise from DataCamp:

Exercise Explanation:

The exercise involves using the NumPy package to create an array from the given 'height_in' list. The goal is to convert the heights from inches to meters and print the resulting values.

Answer Code:

```
import numpy as np
np_height_in = np.array(height_in)
print(np_height_in)
np_height_m = np_height_in * 0.0254
print(np_height_m)
```

Explanation of the Code:

We first import NumPy as np and convert the 'height_in' list into a NumPy array named np_height_in. We then convert the values to meters by

multiplying the array by 0.0254, the conversion factor from inches to meters. Finally, we print both arrays.
