# Debugging Errors (Step 3)

Debugging is an essential skill for all coders, and it comes from making many mistakes and learning from them.

Instructions:
1. Debug and fix the SQL query provided.
2. Find the two errors in this code; the same error has been repeated twice.
3. Find the two bugs in this final query.

Original Uploaded Image:

Corrected SQL Query Implementation:

-- Debug this code
SELECT COUNT(birthdate) AS count_birthdays
FROM people;

Explanation of Corrected Query:

1. **Correct function name**: The original query mistakenly used `COUNNT` instead of `COUNT`. This typo was corrected.
2. **Alias properly**: The alias `count_birthdays` is correctly used to rename the resulting column for better readability.
3. **No additional bugs**: The final query now runs successfully and returns

the count of non-NULL values in the `birthdate` column of the `people`
table.
