SQL Query: Find Cities That Are Also Country Names

SQL Query:

-- Return all cities with the same name as a country
SELECT name
FROM cities
INTERSECT
SELECT name
FROM countries;

Explanation:

1. `SELECT name FROM cities`: Selects the `name` column from the `cities` table.
2. `INTERSECT`: Ensures that only rows that are common to both datasets are included in the result.
3. `SELECT name FROM countries`: Selects the `name` column from the `countries` table.

This query returns only those city names that are also present as country names.
